Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Files_and_strings	3
Foo_et_al	5

Chapter 2

Class Documentation

2.1 Files_and_strings Class Reference

Static Public Member Functions

- static bool [is_integer](#) (const string digit_string)
Determines whether a string is an integer, useful for counting the number of spheres.
- static vector< string > [split](#) (const string &s, char delimiter)
Splits and separates strings based on some delimiter.
- static char * [get_command_option](#) (char **begin, char **end, const string &option)
retrieves string after command line options used at runtime
- static bool [check_for_command_option](#) (char **begin, char **end, const string &option)
checks whether a command line option is used at runtime

2.1.1 Member Function Documentation

2.1.1.1 [check_for_command_option\(\)](#)

```
static bool Files_and_strings::check_for_command_option (  
    char ** begin,  
    char ** end,  
    const string & option ) [inline], [static]
```

checks whether a command line option is used at runtime

Parameters

<i>begin</i>	(char**) is the first character of the string that matches the "option"
<i>begin</i>	(char**) is the last character of the string that matches the "option"
<i>option</i>	is a string consisting of the command line option we want to retrieve

Returns

true if the string is of finite size

2.1.1.2 get_command_option()

```
static char* Files_and_strings::get_command_option (
    char ** begin,
    char ** end,
    const string & option ) [inline], [static]
```

retrieves string after command line options used at runtime

Parameters

<i>begin</i>	(char**) is the first character of the string that matches the "option"
<i>begin</i>	(char**) is the last character of the string that matches the "option"
<i>option</i>	is a string consisting of the command line option we want to retrieve

2.1.1.3 is_integer()

```
static bool Files_and_strings::is_integer (
    const string digit_string ) [inline], [static]
```

Determines whether a string is an integer, useful for counting the number of spheres.

Parameters

<i>digit_string</i>	is an arbitrary string containing information
---------------------	---

Returns

the first index in the string that is not an integer

2.1.1.4 split()

```
static vector<string> Files_and_strings::split (
    const string & s,
    char delimiter ) [inline], [static]
```

Splits and separates strings based on some delimiter.

Parameters

<i>s</i>	is an arbitrary string you want to separate into a vector
<i>delimiter</i>	is the character used to delimit separate quantities in the string

Returns

a vector of strings, with each element being a quantity separated by the delimiter in the original string

The documentation for this class was generated from the following file:

- classes.hh

2.2 Foo_et_al Class Reference

Static Public Member Functions

- static double [get_volume](#) (double radius)

Returns the volume of a single 3-sphere.

2.2.1 Member Function Documentation

2.2.1.1 [get_volume\(\)](#)

```
static double Foo_et_al::get_volume (  
    double radius ) [inline], [static]
```

Returns the volume of a single 3-sphere.

Parameters

<i>radius</i>	is a double precision float for the radius of the sphere. \returnis $4./3 * \pi * \text{radius} * \text{radius} * \text{radius}$
---------------	--

The documentation for this class was generated from the following file:

- classes.hh
